

## Assembly

All Comfy cow brushes are ready to use upon delivery and are very easily assembled in any barn. Due to the well thought-out wall plate with pre-drilled holes, the cow brushes can be mounted on any post. In addition, the cow brushes can also be attached to a wall by using the optional mounting bracket.

## Safety

Comfy's cow brushes are all equipped with an overload safety device. This will stop the brush if the resistance is too high or in case of excessive heat. This guarantees the safety of you, your animal and your environment.

# Comfy Cow brushes

# Enhance welfare and increase milk production!

## About us

We believe that optimal comfort for animals in livestock farming contributes to the improvement of animal welfare but also to the quality and production in livestock farming. With our many years of experience, we are able to transform any animal welfare issue into innovative and technological solutions. All this with just one goal: better animal welfare!

# Comfy

Innovations for  
animal welfare

# Increase your milk production with our special range of Comfy Cow brushes for cows.

Comfy has extensive experience in the design of various cow brushes. The robust design takes into account the environment in which the brush has to work. In addition, we have implemented many features aimed at maximising animal welfare, safety and, of course, energy consumption. The range of cow brushes can be differentiated by the parts of the animal to be brushed, the place where the brush is mounted and by the target group.

## COSY COW COW BRUSH

The Cosy Cow cow brush is characterised by its compact design. The Flowstart system ensures that the brush always starts in the correct direction of rotation, regardless of how the animal approaches the brush. The cow brush has two directions of rotation as standard and can therefore rotate both clockwise and

anticlockwise in a rocking motion. The bristles are made of nylon, have a large diameter and are easy to replace.

**One brush is enough for 50 to 60 cows.**

<b>Brush frame dimensions</b>	811 x 701 x 390 mm
<b>Brush diameter</b>	ø 390 mm
<b>Brush length</b>	612 mm
<b>Power</b>	24V
<b>Power usage per hour</b>	0.12 Kw
<b>Weight</b>	33 kg
<b>Brush rotation speed</b>	58 rpm
<b>Movement</b>	Rocking
<b>Direction of rotation</b>	Clockwise / anti-clockwise

The Cosy Cow is also available in a basic version where the brush is not driven by a motor but by the animal itself. An intelligent design allows the animal to turn the brush in one direction by rubbing their skin against it. The opposite direction is blocked for optimal brushing effect.

## THE COMFORT COW COW BRUSH

The Comfort Cow cow brush features an angled, rotating brush that can be pushed upwards by the cow itself. Thanks to the ergonomic shape and extra long brush shaft, hard-to-reach areas such as the head, back, tail and the side of the cow can be easily brushed. The brush has two directions of rotation, and will rotate in the opposite direction after every restart. The brush uses Touchstart technology that activates the brush after it is moved up or down by the cow. **One brush is sufficient for 50 to 60 cows and requires little or no maintenance.**

<b>Brush frame dimensions</b>	1016 x 834 x 390 mm
<b>Brush diameter</b>	ø 390 mm
<b>Brush length</b>	781 mm
<b>Power</b>	24V
<b>Power usage per hour</b>	0.12 Kw
<b>Weight</b>	36 kg
<b>Brush rotation speed</b>	58 rpm
<b>Movement</b>	Upwards / downwards
<b>Direction of rotation</b>	Clockwise / anti-clockwise

The Comfort Cow is also available in a basic version where the brush is not driven by a motor but by the animal itself. An intelligent design allows the animal to turn the brush in one direction by rubbing their skin against it. The opposite direction is blocked for optimal brushing effect.

## Special designed for your animals.

Every Comfy brush design incorporates some well thought-out innovations. For example, we believe it's important that the brush starts up easily when touched by the animal. The Touchstart technology activates the brush when it is lifted or pushed down. With Flowstart technology, we go a little further because the brush detects the walking direction of the animal. This allows the brush to always start in the correct direction of rotation.

The integrated 24 Volt motor is very economical. In addition, this increases safety because there are no high voltage sources being applied directly to the frame. Lastly, we use nylon bristles because they retain their shape for longer. This maintains a good brushing action and allows the dirt to be more easily discharged from the brush roller.
